

Don Bosco Institute of Technology, Kurla(W)
Department of Electronics and Tele-Communication Engineering
ECL304 - Skill Lab: C++ and Java Programming
Sem III
2021-22

Lab Number:	6
Student Name:	Nadhanial Antony
Roll No :	16

Title:

1. To perform Multiple Inheritance in C++. Create a student class representing student roll number, name and branch and an exam class (derived class of student) representing the scores of the student in various subjects (maths, physics and chemistry) and sports class representing the score in sports. The sports and exam class is inherited by a result class which adds the exam marks and sports score to generate the final result.
2. To perform Hierarchical Inheritance in C++. Create an Employee class with attributes EmpID and EmpSalary. Also create necessary methods/constructors to accept these values from the user. Create classes permanentEmployee and TemporaryEmployee which will be derived classes of Employee. Mention hike attribute in these derived classes and calculate the total salary using generate_salary() method for respective types of employees. Objects of the derived classes should be created and salaries for the permanent and temporary employees should be calculated and displayed on the screen.

Learning Objective:

- Students will be able to perform multiple inheritance using C++.

Learning Outcome:

- Understanding the inheritance concept and reusability of the code.

Course Outcome:

ECL304.2	Comprehend building blocks of OOPs language, inheritance, package and interfaces
-----------------	--

Theory:

- Explain in details about inheritance, its types, syntaxes and block diagrams.

Inheritance is the process of creating a new Class, called the **Derived Class**, from the existing class, called the **Base Class**. The Inheritance has many advantages, the most important of them being the reusability of code. Rather than developing **new Objects** from scratch, new code can be based on the work of other developers, adding only the new features that are needed. The reuse of **existing classes** saves time and effort.

Types of inheritance:

Don Bosco Institute of Technology, Kurla(W)
Department of Electronics and Tele-Communication Engineering
ECL304 - Skill Lab: C++ and Java Programming
Sem III
2021-22

- ✦ Single Inheritance - When a **Derived Class** to inherit properties and behavior from a single **Base Class** , it is called as single inheritance.

Syntax - *class Base*

```
{  
// BODY OF THE BASE CLASS  
};  
class Derived : access_specifier Base  
{  
// BODY OF THE DERIVED CLASS  
};
```

- ✦ Multi Level Inheritance - A **derived class** is created from another derived class is called **Multi Level Inheritance** .

Syntax :

```
class A // Base class  
{  
// BODY OF CLASS A  
};  
class B : access_specifier A // Derived class of A  
{  
// BODY OF CLASS B  
};  
class C : access_specifier B // Derived from derived class B  
{  
// BODY OF CLASS C  
};
```

Don Bosco Institute of Technology, Kurla(W)
Department of Electronics and Tele-Communication Engineering
ECL304 - Skill Lab: C++ and Java Programming
Sem III
2021-22

- ✦ Hierarchical Inheritance - More than one **derived classes** are created from a single base class, is called **Hierarchical Inheritance**.

Syntax :

```
class A // Base class of B
{
// BODY OF THE PROGRAM
};
class B : access_specifier A // Derived class of A
{
// BODY OF THE PROGRAM
};
class C : access_specifier A // Derived class of A
{
// BODY OF THE PROGRAM
};
class D : access_specifier A // Derived class of A
{
// BODY OF THE PROGRAM
};
```

- ✦ Hybrid Inheritance - Any combination of above **three inheritance** (single, hierarchical and multi level) is called as **hybrid inheritance**.

Syntax :

```
class A
{
// BODY OF THE CLASS A
```

Don Bosco Institute of Technology, Kurla(W)
Department of Electronics and Tele-Communication Engineering
ECL304 - Skill Lab: C++ and Java Programming
Sem III
2021-22

```
};  
class B : public A  
{  
// BODY OF THE CLASS A  
};  
class C  
{  
// BODY OF THE CLASS A  
};  
class D : public B, public C  
{  
  
// BODY OF THE CLASS A  
};
```

- ✦ **Multiple Inheritance** - Multiple inheritances allows programmers to create classes that combine aspects of multiple classes and their corresponding hierarchies.

Syntax -

```
class A // Base class of B  
{  
// BODY OF THE CLASS A  
};  
class B // Derived class of A and Base class  
{  
// BODY OF THE CLASS B  
};  
class C : access_specifier A, access_specifier A // Derived class of A and B  
{  
// BODY OF CLASS C  
};
```

Algorithm 1 :	1 – Create a parent class student and initialize its data members. 2- Create the derived class of student class - exam class to take input of marks
	3 - Create sports class to take input of marks 3 – Create the result class to inherit the exam class and sports class publically and to calculate the total. 4 – Create the main function to call the class functionality and display the result.s

Sem III
2021-22

```
cout<<"Enter Physics Marks"<<endl;

cin>>physics; cout<<"Enter chemistry
Marks"<<endl; cin>>chemistry;
cout<<"Enter Maths Marks"<<endl;
cin>>maths;

}

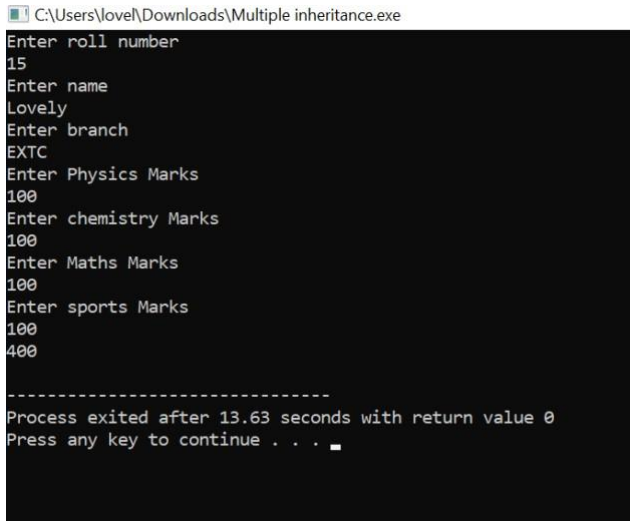

};

class sport{
    public: int sports; sport(){
        cout<<"Enter sports Marks"<<endl;
        cin>>sports;
    }
};

class result : public exam, public sport {
    public:
        int total;
        result(){
            total = maths + physics + chemistry + sports;
            cout<<total<<endl;
        }
};

int main()
```

ECL304 - Skill Lab: C++ and Java Programming
Sem III
2021-22

	<pre>{ result obj; return 0; }</pre>
Input given 1:	ROLL NO – 16 BRANCH -EXTC PHYSICS MARKS -100 CHEMISTRY MARKS -100 MATHS MARKS – 100 SPORTS MARKS – 100 TOTAL = 400
Output Screenshot 1:	 <p>The screenshot shows a Windows command prompt window titled "C:\Users\love\Downloads\Multiple inheritance.exe". The program prompts for the following inputs: roll number (15), name (Lovely), branch (EXTC), Physics Marks (100), chemistry Marks (100), Maths Marks (100), and sports Marks (100). The output shows the total marks as 400. At the bottom, it states "Process exited after 13.63 seconds with return value 0" and "Press any key to continue . . .".</p>
Algorithm 2:	<ol style="list-style-type: none"> 1. Creating the parent class employee and initialize its data members.(EmpId ,EmpSalary) and a basic function get details() to print the details. 2. Create 2 child class permanent employee and temporary employee that inherit employee class publically. 3. In this classes , create generate salary() that return the employee salary + hike in their salary 4. In main function, Create the object of derived class and print their respective details.

	<pre> T.getDetails(); cout<<endl<<endl<<"For Permanent Employee: "<<endl; Permanent_Employee P(777.99); cout << endl << endl << "Details of Permanent_Employee : " << endl; P.getDetails(); return 0; } </pre>
Input given 2:	<p>For temporary employee –</p> <p>Employee id – 212</p> <p>Employee sal – 2000</p> <p>For permanent employee –</p> <p>Employee id – 312</p> <p>Employee sal – 5000</p>
Output Screenshot 2:	 <p>The screenshot shows the output of a C++ program. It first prompts for a temporary employee, where the user enters ID 212 and salary 2000. It then displays the details for the temporary employee: EmployeeID is 212 and Employee Total Salary is 2667.6. Next, it prompts for a permanent employee, where the user enters ID 312 and salary 5000. It then displays the details for the permanent employee: EmployeeID is 312 and Employee Total Salary is 5777.99. The program ends with a message: "Process exited after 35.76 seconds with return value 0" and "Press any key to continue . . .".</p>
